Minor Release of AHRQ Quality Indicators^{TM} Software for v2018.0.1 ICD-10-CM WinQI (Non-Risk Adjusted), August 2018

The Agency for Healthcare Research and Quality (AHRQ) announces a minor release of the AHRQ Quality Indicators (QI) software version v2018.0.1 for WinQI (Non-Risk Adjusted). The WinQI version v2018 software was released in June 2018. This minor release fixes two of the recently identified minor software discrepancies. Please note that:

1. The discrepancies identified in v2018 **do not impact the indicators' rates** in the software. So, If you have used WinQI v2018 to generate QI rates, **those rates are accurate**.
2. The fixes in the minor release are related to WinQI functions only and do not impact SAS QI v2018 software. No changes are done to SAS QI v2018.

1.0   Fixes to WinQI Software Bugs

- **The Present on Admission (POA) column data missing in the Exported file**

This issue relates to the data export function in WinQI v2018. You can access this function by clicking on the top left menu and choosing the "Export Data" option. In the exported file (.csv, .xlsx, .json, .tfs), one of the columns, "POA" - Present on Admission was missing the data. This issue is now fixed and the POA values provided in your input discharge file is now correctly included in the exported file.

- **Automation**

Some users received random issues with the automation function. This issue impacted both the Basic and Record & Play Automation function. In some instances, when the automation script is called using the command line utilities, it did not save the exported QI results. This was not an issue if users ran the automation scripts within the WinQI interface. This issue is now fixed, and QI results are exported every time the automation scripts run using a command line utility.
