

WinQI 2019 Data Patch

This is a command line program designed to add a few missing MS-DRG lookups in the Quality Indicators database.

Who should run this patch?

This is for users who are on WinQI v2019 version and expects to have WinQI generate MDC values from their MS-DRG code in their input data.

***Important:** If you have already upgraded to WinQI v2020, there is **no** need to run this patch.

How to run the patch?

Run the WinQI_2019_DataPatch.exe as admin, i.e. right click on this file once downloaded and select Run as administrator. This will open a command line and run the patch. If for any reason, the patch errors out, at the command line add a parameter containing the location of the key.qiconfig file in your computer.

Here is an example how you will run it on command line if you get into any error:

```
C:\<path to the downloaded exe file>WinQI_2019_DataPatch.exe "<path where WinQI is installed>\AppConfig\key.qiconfig"
```

A successful patch application results in the following message:

```
"Data Patch successfully applied. Press any key to end program"
```
